# Tusker Management — Product Overview

Oct 8, 2026 · @Sufi

## What it solves

Tusker brings a construction business's daily operations into one place: projects, purchasing, attendance and team communication. Most firms run these across spreadsheets, WhatsApp groups, email and paper registers, so information goes missing and managers lack a live view.

- **One source of truth.** Tasks, material orders, vendor quotes and attendance all sit in a single workspace.
- **Office and site stay in sync.** The web app and mobile app share the same live data and send instant notifications.
- **Controlled purchasing.** Every material request follows an approval chain, from the request through to the purchase order.
- **Less admin.** Travis, the built-in AI assistant, answers questions and handles routine updates on request.

## Key features

| Area | What you can do |
|---|---|
| Project & task management | Plan work in List, Kanban or Gantt views. Add subtasks with dependencies and drag to reschedule. Use tags, comments, attachments and a full activity history. |
| Procurement | Run the full flow: material request (indent), request for quotation, vendor quotes, side-by-side comparison, then purchase order, with approvals at each step. Read quotes from scanned PDFs or images automatically. Export to Excel and PDF. |
| Vendor management | Keep a vendor directory with GSTIN verification, the materials each vendor supplies and their rates. Get suggested vendors for each requirement. |
| Attendance & leave | Track attendance by shift and location, including a face-recognition check-in kiosk. Handle leave requests, public holidays and leave forecasts. |

| Area | What you can do |
|---|---|
| Team & departments | Set up departments with their own shift timings. Show birthdays and company announcements. |
| Daily reports | Staff submit structured daily reports and managers review them. |
| Meetings & calendar | Schedule meetings with an agenda. View them by week or month. |
| Personal space | Each person gets their own to-do list, direct messages and a board of their assigned work. |
| Travis AI assistant | Ask in plain language about overdue tasks, deadlines, workload, attendance or purchasing. Travis can also create and assign tasks, update status, and draft or submit daily reports, leave requests and material requests. It asks for your confirmation before every change. |
| Mobile app | iOS and Android app for site teams, with push notifications and a touch-friendly Gantt chart. |
| Roles & permissions | Seven roles (Owner, Admin, Manager, Procurement, Accounts, Member, Viewer), project-level access, and admin-editable permission settings. |

## Integrations & platform

- **Sign-in:** Google, GitHub or email. One account works on web and mobile.
- **Real-time updates:** changes appear instantly for everyone, and mobile users get push notifications.
- **Secure file storage:** attachments and documents are stored in cloud storage.
- **GSTIN verification:** vendor tax details are checked against the official registry.
- **Attendance API:** other systems and dashboards can securely read daily attendance totals.
- **Security:** every action is checked against the user's role and project access. The AI assistant follows the same rules and cannot make the same change twice by accident.

# Summary

Tusker replaces scattered spreadsheets, chat groups and paper registers with one platform for projects, procurement and people. Office and site teams work from the same live data, purchasing goes through approvals, and Travis takes on routine updates.
